Installation Manual

1. *Creating the user account*

Create your personal web portal account on **www.mycpod.com** by sending the registration text message, logging in and completing the setup wizard.

a. **Send registration text (SMS) message**

Send a text (SMS) message containing the activation code of your C-pod unit to the C-pod System Number. The activation code is printed on the label on your C-pod main unit. It has the format 1703200-XX-XXXXX-XX; all hyphens must be included and no other characters can be added.

C-pod System Number

Store this number in your phone!

International:
+46737494090

United States:
1-814-222-0747
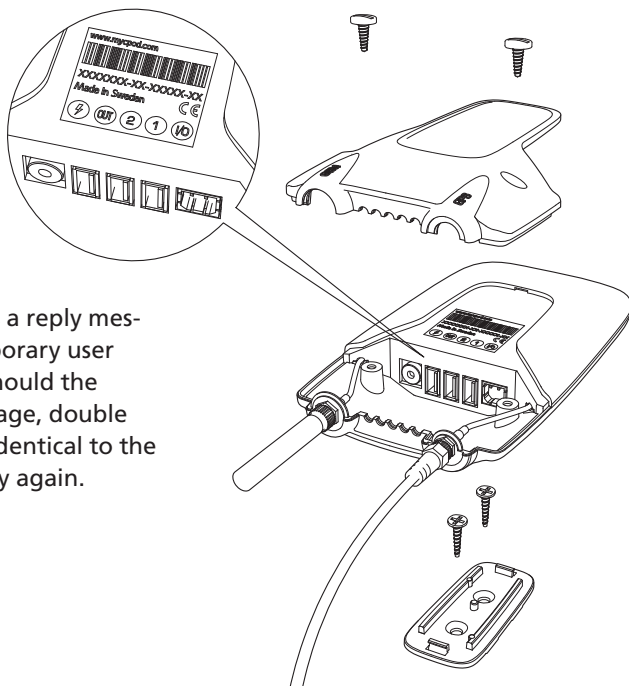

The C-pod Server sends a reply message containing a temporary user name and password. Should the server reject your message, double check that the code is identical to the one on the label and try again.

Installation Manual

1. *Creating the user account (continued)*

b. Login & complete wizard

Use the temporary login data you just received to log on to **www.mycpod.com**, where you are guided through an installation wizard. Complete the steps until the wizard tells you to install the C-pod in your boat. Your personal web portal account has been created.
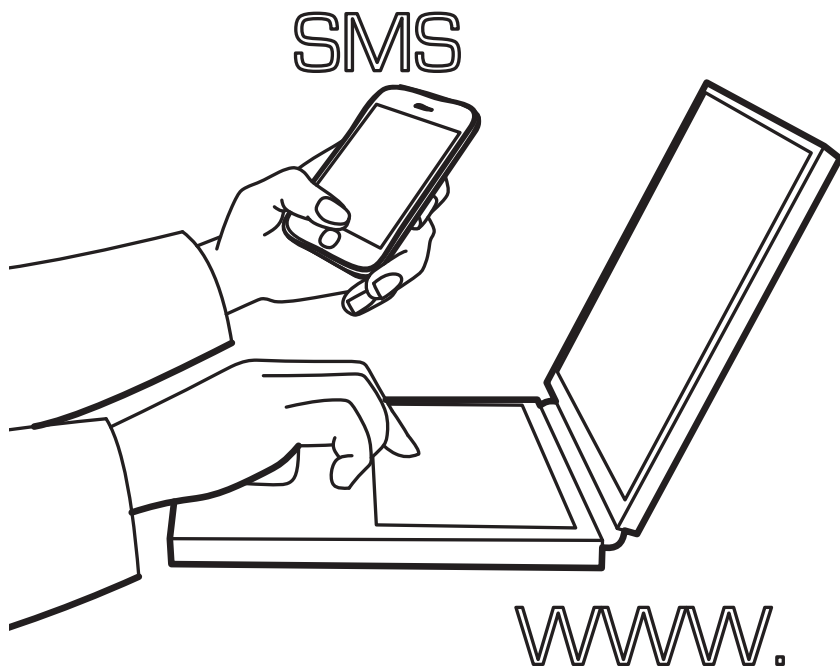

Note: The password must contain at least 7 characters and 1 number. Don't choose a guessable password!

Installation Manual
2. *Installing the system*

The following steps describe the installation procedure in the boat.

a. Check package contents
Included in the box:

– C-pod main unit
– Fastener for the main unit
– GPS antenna
– Cellular (GSM) network antenna
– Magnetic intrusion sensor
– Power cable
– Activation button
– Hook-and-loop fastener for the GPS antenna
– Manual
– Warranty Sheet

In addition to this, you may need (not included):

– Screws or bolts (depending on mounting surface and location); suitable drill for the screws or bolts
– Drill for the activation button (16 – 18 mm / 0.6 – 0.7 inches)
– 1A – 2A fuse (slow) and suitable fuse holder
– Cable connectors/cable shoes to connect the power cable to the power supply (battery)
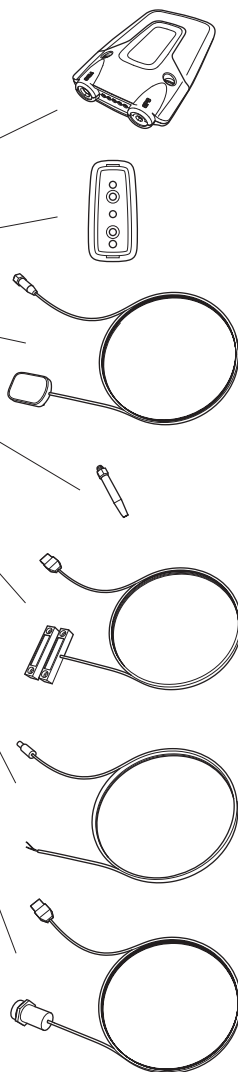

Installation Manual
2. *Installing the system (continued)*

b. **Find a suitable onboard location for the C-pod**
The C-pod should be installed in a well hidden and dry place onboard. Other factors that must be considered are cellular (GSM) network and GPS signal reception, access to constant power supply and cable lengths for the supplied equipment.

The C-pod main unit is designed to be mounted vertically with antennas facing downwards. A different orientation may affect the cellular (GSM) network signal quality and moisture protection.

The cellular (GSM) network antenna is attached directly to the unit and must be well above the water line. Avoid places shielded from cellular (GSM) network signals, e.g. inside metal boxes, enclosed in carbon fiber etc.

The C-pod must have a constant power supply to protect your boat even when other equipment is turned off by the battery isolation switch. Make sure that there is an appropriate power source within the range of the power cable.

c. **Mount the equipment & connect the parts**
Attach the twist-on fastener in the desired location using two screws or bolts. Secure the C-pod unit by centering the unit's mounting point to the guiding pin on the fastener and twisting clockwise **or** counter-clockwise until the unit is locked in place. To detach the C-pod unit, twist in any direction to release it from the fastener.
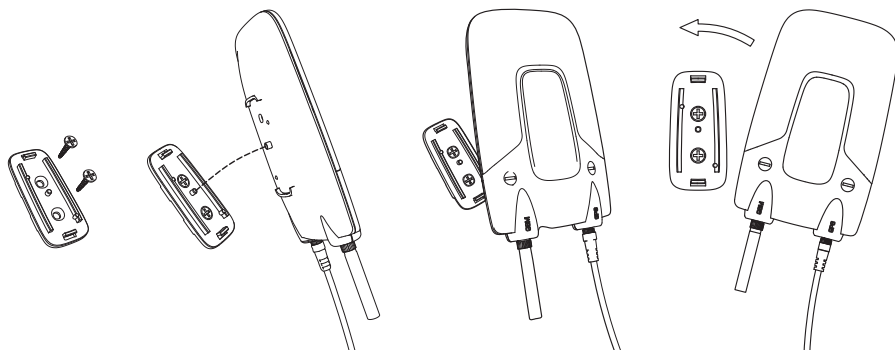

Installation Manual
2. *Installing the system (continued)*

The **GSM antenna** screws on to the contact marked GSM on the C-pod unit.

The **GPS antenna** has a 3 meter cord that attaches to the contact marked **GPS** on the unit. The antenna must be placed horizontally with the plastic dome facing **upwards**. Find a hidden location with as little material between the antenna and the sky as possible. Avoid locations that might be shielded from GPS signals, e.g. close to metal boxes or carbon fiber etc. The antenna is not designed to be mounted outside. The provided hook-and-loop fastener can be used to attach the GPS antenna.
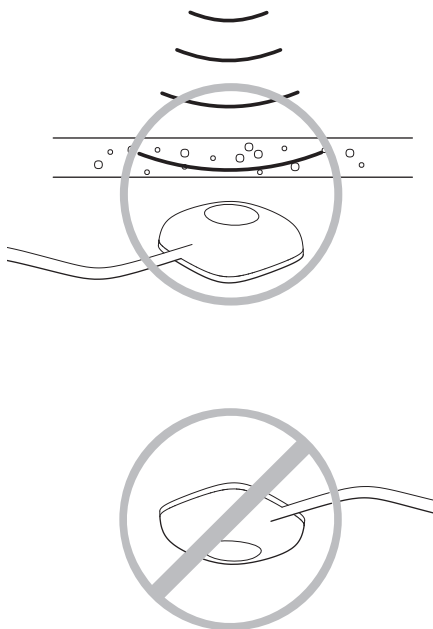

Note: The GPS antenna is magnetic and may disturb other equipment, such as compasses.

Note: For sailing boats a placement close to the center line improves the GPS reception when sailing keeled over.

Installation Manual
2. *Installing the system (continued)*

The **activation button** should be discreetly located inside the area protected by the magnetic intrusion sensor, so that it can be reached within 45 seconds of entering the boat to deactivate the alarms. The button has a LED indicator in the center which must be visible. Connect the button to the contact marked (I/O) on the C-pod.
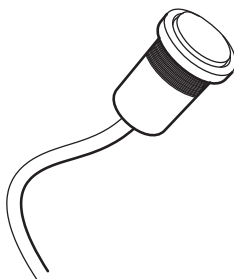

Attach the **magnetic intrusion sensor** to the desired door or hatch. When the door or hatch is closed the gap between the magnet (no cable) and the reed switch (with cable) must not exceed 15 mm to avoid an unstable operation and false alarms. Connect the magnetic intrusion sensor to the contact marked (1) on the C-pod.

max 15 mm
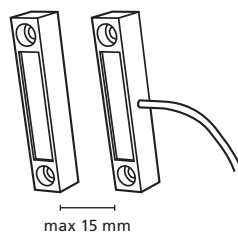

Note: If you choose not to install the magnetic intrusion sensor, refer to section 5b.

Note: If you have purchased optional accessories refer to section 5c. and the instructions on the accessory packaging.

Installation Manual
2. *Installing the system (continued)*

d. Power supply
The C-pod can be powered by 12 or 24V DC. It needs constant power and it is recommended to attach the power cable directly to the battery. Make sure the power supply cannot be interrupted by switching off any battery isolation switch onboard. It is advised to shorten the power cable to minimize voltage loss and give more exact battery voltage readings.

The cable must be protected by a 1 – 2 A fuse (slow) or a thermal circuit breaker mounted as close to the power source as possible. Strip the plus (red) and minus (black) wires on the power cable and connect them to the power source using suitable cable connectors/cable shoes.
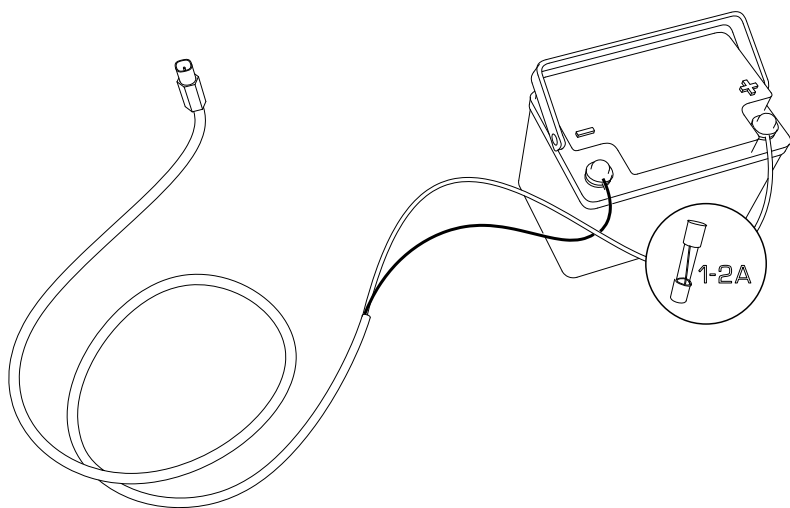

Note: Fuse and fuse holder are **not** included in the package.

Note: Before proceeding, it is recommended to measure and verify the received voltage on the power plug using a voltmeter!

Note: Some optional accessories **cannot** be used if the C-pod is powered by 24V DC.

Installation Manual
3. *System start-up*

Connect the power plug to the power port marked with ⚡ on the C-pod. The C-pod starts up. Pay attention to the flashing of the activation button, which shows the start-up progress.

- The activation button flashes **once every second** until the C-pod has connected to the strongest available cellular (GSM) network.

- The activation button flashes **once every 3 seconds** until a GPS position has been received.

- The activation button flashes **once every 30 seconds** in normal operating mode to indicate that the system is running. The start-up sequence is completed.

- ▸ *A complete list of flash patterns and their meaning is available in the Reference manual.*

Note: The start-up sequence normally takes a few minutes or more, as the C-pod scans all available network operators and receives configuration settings.

Hint: Before leaving the boat it is recommended to double-check that the installation and system start-up has been successful by sending the text (SMS) command status or position to the C-pod System Number. (Refer to the Reference manual, section Text (SMS) commands.)

Installation Manual
4. *Finishing the setup*

Once the installation in the boat is completed, log on to the web portal with your personal user name and the password you chose in the installation wizard.

> **Note:** In case you have forgotten your login data, send the text (SMS) command **login** to the C-pod System Number. (See the Reference manual, section *Text (SMS) commands*.)

a. Verify cellular (GSM) network/GPS position
Verify that the C-pod has a working communication and has obtained a GPS position. If this is unsuccessful, you need to check the installation of the C-pod unit. Refer to the Troubleshooting Guide, sections Communication related problem and/or GPS related problems, or contact your retailer or the C-pod Technical Support if this does not help..

b. Billing information
The monthly service fee is automatically charged to your credit card (VISA and Mastercard accepted). Enter your credit card information and proceed with the first monthly payment through our secure (SSL-encrypted) payment portal. Please note that no credit card data is stored on our servers. The credit card used for the subscription can be changed later from your personal C-pod web portal. You can also find information about payments and the subscription online.

In addition to monthly payments we offer ou customers the possibility to pre-pay 12 and 24 months at a discounted price. Our pre-paid options need to be setup manually so please contact C-pod Technical Support to set this up on your account. Please note that it is possible to switch to pre-paid at any time.

When the payment wizard is completed, you are redirected to your personal web portal.

Installation Manual
5. *Configuring the system*

Before starting to use the system to full extent, some settings need to be configured. Navigate by clicking on the menu items to the left.

a. Action Plan
The *Action Plan* defines which text (SMS) and/or e-mail messages are sent to which recipient(s) in case an alarm or warning is triggered. The cell phone number you used to create your account is already in the list. Other receivers could, for instance, be a security company, a guard in your marina or a relative.

> **Note:** Some mobile phone operators may charge for received text (SMS) messages. Always inform persons you add to the Action Plan!

b. Accessories
If you have chosen **not** to install the magnetic intrusion sensor and have installed no other sensor(s) on Alarm loop 1, you need to disable it. Go to the menu *Alarms*, then click *Send configuration*. Activating an alarm loop without any sensor leads to an instant false alarm!

If you have purchased **extra accessories**, they need to be added to the *Accessories* list. Refer to the accessory's manual.

c. Battery Level Warning
The *Battery level warning* is set to a default value that fits most 12V systems. Choose 12V or 24V in the drop-down menu depending on the system in your boat. Select the desired warning threshold.

Hint: Check the external battery voltage on the web portal when the boat's battery is fully charged and choose a slightly lower value as warning level.

Installation Manual

5. *Configuring the system (continued)*

d. **Communication Warning**

The *Communication warning* is turned off by default. It monitors the GPRS data traffic, which requires a sufficient cellular (GSM) network signal quality. If the cellular (GSM) network is strong at the location of your boat, you can turn it on. As long as no warning message is sent, the system communication is working.

If the communication fails **four times** in a row (i.e. after 4 hours) the communication warning is triggered. It is automatically reset when the GPRS data communication works again.

> **Note:** It is common that the strength of cellular networks varies during day and night, so this setting often needs to be evaluated for a while. If the network is too weak, you occasionally get communication warnings; consider turning it off. Refer to the Troubleshooting Guide, section *Communication related problems*.

User Guide

This part covers the most important operating instructions for your C-pod Security System. The web portal is the most detailed and convenient way to manage your C-pod Security System. There is a more detailed description on each page on the web portal.

System Mode
There are two system modes, which offer different features and system behaviors.

Active mode
In *Active mode* the system is fully operational. Alarms can be activated and deactivated, warnings are on. In case of an alarm or warning event, messages are sent to the recipients specified in the Action Plan. The system data is updated automatically and the GPRS data traffic is checked hourly.

Passive mode
In *Passive mode* all alarms and warnings are turned off and there is no active monitoring of the unit by the C-pod Server. No alarms or warning notifications are sent. This mode is intended for longer periods during which you do not need or wish to have alarm protection or receive notifications, e.g. during winter storage in a protected area or when the C-pod is turned off.

Status reports
Getting a *status report* from the C-pod System is possible in both modes. This makes it possible to e.g. check the battery voltage during winter storage when the system is in Passive mode.

User Guide

Alarms

There are three different alarm types (four different alarms) which can be switched on and off by the user. If any alarm is triggered, a corresponding alarm message is sent to the recipient(s) specified in the *Action Plan*. A GPS tracking is started automatically which continues as long as the alarm is in triggered state.

Please note: If triggered alarms are not reset or deactivated within 6 hours the notifications are resent as a reminder.

Geofence

The *Geofence* alarm uses GPS positioning and reacts on unauthorized movement of your boat. Upon activation, the current GPS position is saved. The C-pod compares the saved position to the actual current position several times a minute. If a position more than 250 m (yards) away is detected, the Geofence alarm triggers.

Alarm Loops

There are two alarm loops, which work identically. The choice of external sensors on the loops defines what they will react on. The magnetic intrusion sensor from the basic package is usually connected to *Alarm loop 1*. Optional equipment can replace the magnetic intrusion sensor or is connected to *Alarm loop 2* (refer to the Reference manual). If the (normally closed) sensor loop is broken, the corresponding loop triggers an alarm. Depending on which sensors are connected to the loop that triggered, someone entered the boat (magnetic sensor and motion detector), a fire has started (smoke sensor) or water is getting into the boat (water level sensor). When using two or more sensors, we recommend separating intrusion and environment related sensors to different alarm loops.

Battery Disconnect

If the voltage suddenly drops from the normal value of around 12V (or 24V) to zero, the *Battery disconnect alarm* triggers. This happens if the power supply to the C-pod is cut. In this case, the alarm loops are turned off to save the back-up battery power and to maximize the GPS tracking duration.

User Guide

Warnings

There are four different warnings. Warnings are reset automatically if the corresponding parameter reverts to the allowed value.

Communication Warning

The *Communication warning* triggers if the GPRS data traffic to and from the C-pod does not work. Normally this is due to a weak cellular (GSM) network where the boat is located, and does not mean that the C-pod System cannot communicate at all. It uses the slower method of data text (SMS) messages instead.

Battery Level Warning & Power Save Warning

The *Battery level warning* is triggered if the voltage drops below the user defined value. The Power save warning is triggered if the voltage drops below 11.2V. The two alarm loops are turned off, since a voltage this low has an unstable effect on most sensors. Also, the C-pod reduces the power load on the boat's battery.

Billing/Credit card related warnings

These warnings alert you if there is a problem with the withdrawal of money for the monthly service charge from your credit card.

User Guide

Activate and Deactivate Alarms

Activation
Alarms that you wish to use when activating the alarm system have to be *enabled* on the web portal. All enabled alarms are activated in a group. Alarms in the state *disabled* are not activated. Alarm loops that have no sensors attached **must** be disabled; otherwise you get an instant false alarm for that loop upon activation!

There are four ways of **activating** the alarms.

- The **activation button** located in your boat can be used for activation just before leaving the boat. Press the button for a second and it replies with 4 short flashes as confirmation. You have 45 seconds to leave the pro-tected area of your boat before the alarms are active.

4x
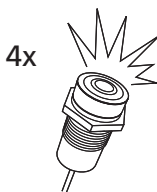

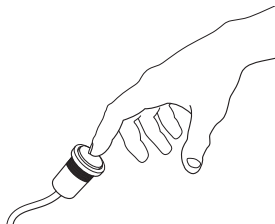

- Send the **text (SMS) command** *activate* to the C-pod System Number. Any commands must be sent from the main cell phone number; otherwise the system cannot recognize you. Text (SMS) commands can be sent wherev-er you are. Refer to the Reference manual, section *Text (SMS) commands*.

- Log on to the **web portal**, go to the menu *Alarms* and click *Activate alarms*. Here you also can monitor the activation progress.

- Using the **remote control** (optional accessory), you can stand outside of your boat to activate the alarms.

User Guide

Activate and Deactivate Alarms (continued)

Deactivation

All enabled and active alarms are deactivated in a group. Not triggered alarms are deactivated by any of the methods. Triggered alarms cannot be deactivated using the activation button. See *Triggered alarms* below.

There are four ways of **deactivating** the alarms.

- The **activation button** located in your boat can be used also for deactivation. Within 45 seconds after entering the protected area onboard, press the button for a second and the button replies with one long flash as confirmation.

1x

- Send the **text (SMS) command** *deactivate* to the C-pod System Number. Any commands must be sent from your main cell phone number; otherwise the system cannot recognize you. Text (SMS) commands can be sent wherever you are. Refer to the Reference manual, section *Text (SMS) commands*.

- Log on to the **web portal**, go to the menu *Alarms* and click *Deactivate alarms*. Here you also can monitor the deactivation progress.

- Using the **remote control** (optional accessory), you can stand outside of your boat to deactivate the alarms.
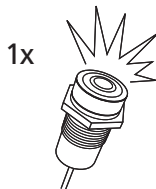

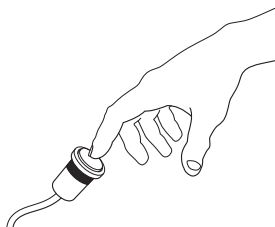

User Guide

Triggered alarms

When an alarm is triggered, the system responds in the following ways:

- **Alarm notifications** are sent to the recipients specified in the *Action Plan*.

- A **GPS tracking** starts instantly. The C-pod sends GPS positions automatically every 15 minutes, as long as alarms are triggered and as long as the C-pod has power. These positions can be viewed on the web portal on the menu *Map*.

- An installed **siren** (optional) sounds only when an alarm loop triggers. Due to various regulations and laws, the alarm sounds for 3 minutes, in intervals of 10 seconds on, 5 seconds off. It does **not** sound on Geofence and Battery disconnect alarms; a silent tracking is prioritized in these cases.

Triggered alarms require immediate user action! Verify what is going on – get a status report and examine the result:

- Geofence alarm – check if the boat seems to be moving or if it might have been a temporary fluctuation in the GPS system.

- Alarm loop – defined by the sensors installed on the triggered loop, determine what is happening on the boat. Deactivate and activate the alarms to rule out a false alarm.

- Battery disconnect alarm – check the battery voltage by getting a status. If the external voltage is shown as (close to) zero the C-pod is not connected to the boat's battery anymore. It is running on the internal battery which lasts for at least 2 days under normal conditions.

Take the necessary action; call someone who is close to the boat, your security company or go see for yourself what is going on.

Alarm notifications are resent every 6 hours as a reminder, for all alarms and to all recipients according to the Action Plan. This does **not** mean that a new alarm has been triggered – **triggered alarms cannot trigger again!**

User Guide

Turn off/reset triggered alarms

Triggered alarms need to be deactivated to stop the GPS tracking and the reminder notifications. Triggered alarms are deactivated the same way as non-triggered i.e. active alarms, except for the activation button.

- Send the **text (SMS) command** *deactivate* to the C-pod System Number. Any commands must be sent from your main cell phone number; otherwise the system cannot recognize you. Text (SMS) commands can be sent wherever you are. Refer to the Reference manual, section *Text (SMS) commands*.

- Log on to the **web portal**, go to the menu *Alarms* and click *Deactivate alarms*. Here you also can monitor the deactivation progress.

- Using the **remote control** (optional accessory), you can stand outside of your boat to deactivate the alarms.

! The activation button located in your boat can **not** be used for deactivation. Pressing the button while alarms are triggered has no effect. This prevents a possible intruder to turn off the alarm and tracking functionality.

Re-activate the alarms! As soon as you have investigated the problem, you should re-activate the alarms to ensure the protection of your boat!

User Guide

Triggered warnings

As soon as a warning is triggered, warning notifications are sent according to the Action Plan. Warnings do **not** trigger a tracking of the system. Triggered warnings require user action.

- Communication warning – check if you can obtain a status. If yes, the C-pod System works but the GPRS data traffic does not. Normally this is due to a weak cellular (GSM) network strength where the boat is located, and does not mean that the C-pod System cannot communicate at all. It uses the slower method of data text (SMS) messages instead. If this warning triggers often, refer to the trouble shooting guide, section *Communication related problems*.

- Battery level warning – the battery voltage has dropped below the user-defined value. The battery most likely needs to be charged soon. If the voltage is allowed to drop further, the *Power save warning* will trigger.

- Power save warning – the battery needs to be charged immediately. The boat's battery voltage is below 11.2V. The two alarm loops are turned off, since a voltage this low has an unstable effect on most sensors. Also, the C-pod reduces the power load on the boat's battery. If this occurs often, refer the Troubleshooting Guide, section *Power related problems*.

- Credit related warning – check if something wrong with your credit card and update the information if neccessary by entering a new credit card. Please note that a small amount will be reserved for up to three days before being released if no subscription amount is due on the account.

Warnings cannot be reset by the user. They are reset automatically if the corresponding parameter reverts to the allowed value. You can choose to disable a warning if you do not wish to be notified about it.

Reference manual

Text (SMS) commands

Text (SMS) commands are a convenient way of obtaining certain data or performing certain tasks. The commands are case insensitive, but are **sensitive** to misspelling and other characters than the command itself.

Command	Short	Example	Action
Position	P	P	System replies with position report
Status	S	status	System replies with status report
Relay [on|off]	r [on|off]	R on	Turns relay on or off
Activate	A	A	Activates all (enabled) alarms
Deactivate	D	dEActiVate	Deactivates all alarms

Installation Test Mode

The Installation test mode is mainly intended for testing purposes after a system has been installed by someone else than the end-user, e.g. a marina or a boat builder.

Requirement: The C-pod must be unregistered, i.e. no activation text message has been sent. The C-pod connects to the C-pod server and checks if it is activated. Entering the Installation test mode is not possible after the activation text (SMS) message has been sent and the account has been created.

▸ **Perform a basic test** - tests the cellular (GSM) network communication, the GPS functionality and the activation button.

1. Connect the activation button and the cellular (GSM) network antenna and the GPS antenna. (Optional: connect one or several sensors to alarm loop 1 and a siren).
2. Connect the C-pod to the external power supply (12 or 24V).
3. Pay attention to the flashing of the activation button, which shows the start-up progress:
   a. The activation button flashes once every second until the C-pod has connected to the strongest available cellular (GSM) network.
   b. The activation button flashes once every 3 seconds until a GPS position has been obtained.

Reference manual

4. The button flashes rapidly (2 flashes every second), when the data has been successfully sent to the server.

▸ **Perform an extended test** - test sensors connected to Alarm loop 1 and the siren (optional). To skip the extended test, proceed to *Step 5*.

    I. Press the activation button for 2 seconds while it is flashing rapidly (2 flashes every second). This starts the Alarm loop 1 and siren test. The flashing stops. Note: This has to be done within 5 minutes after *Step 4*, otherwise you need to reboot the system to get into the Installation test mode, see *Repeat/Exit the Installation Test*.

    II. When any sensor on Alarm loop 1 is triggered (loop is broken) the Activation Button lights up. If a siren is connected to connector 2 it sounds (optional).

    III. Use this to test the Alarm loop 1 installation. If the installation also has sensors on Alarm loop 2, please switch the USB connector for this loop to contact ① and test the sensors as if they were installed on Alarm loop 1.

5. After 5 minutes the systems shuts down by itself and the communication stops. The Installation test mode is completed.

▸ **Repeat/Exit the Installation Test**
Before or after the system has shut down (see *Step 5*), the system can be rebooted by pressing the button for **>30 seconds**, and then releasing it again.

    – If the unit has not been registered, the Installation Test will be repeated from *Step 3*.

    – If the unit has been activated by sending the registration text (SMS) message (refer to the Installation Manual), it will start up and run in the normal operation mode.

In case your C-pod system was installed by a professional installer or a boat builder, it is likely that the system has been powered up before the registration text (SMS) message was sent. In this case, the C-pod entered the Installa-

Reference manual

tion test mode and turned itself off. To start using the system, it needs to be rebooted after the registration message was sent.

Reboot a unit
Performing a normal reboot of the unit forces it to go through the initial start-up sequence, registering on a cellular (GSM) network and obtaining an updated GPS position. It can solve various problems that might occur with your C-pod. *Rebooting a unit only makes sense if the unit already is running, i.e. the activation button is flashing (in any way).*

While onboard, perform the following steps:

- Press and hold the activation button for >30 seconds (31 seconds to be sure), then release the button.
- The C-pod reboots.
- The start-up sequence consists of mainly two steps:
  - ▸ The C-pod searches for and connects to the strongest cellular (GSM) network available. While searching and connecting, the activation button flashes **once every second**.
  - ▸ The C-pod is obtaining a GPS position. While this is done, the activation button flashes **once every 3 seconds**.
- Once the C-pod is registered on the cellular (GSM) network and has obtained a GPS position, it is in the normal operation mode and the button flashes once every 30 seconds.

In case the **first step** takes a very long time (>5 minutes), or never seems to finish, the C-pod has difficulties finding a good cellular (GSM) network. Refer to the Troubleshooting Guide, section *Communication related problems*.

In case the **second step** takes a very long time (>10 minutes), or never seems to finish, the C-pod has difficulties finding a good GPS position. Refer to the Troubleshooting Guide, section *GPS related problems*.

Reference manual

Power-cycle a unit

Power cycling can help a unit to start up if has been without power for a longer time, e.g. after winter storage. *Power cycling a unit only makes sense if the unit is not running, i.e. the activation button is not flashing at all.*

While onboard, perform the following steps:

- Connect the C-pod unit to the power supply and let the internal battery charge for 15 – 30 minutes.
- Disconnect the power cable.
- Press and hold the activation button for 15 – 20 seconds, then release the button to clear the memory.
- Reconnect the power cable.
- ‣ The C-pod starts up; see *Reboot a unit* above for the description of the start-up sequence.

Discharging the internal battery

If the power cycle attempt remains unsuccessful, disconnect the unit from the power supply for three days (~72 hours). Reconnect the power and the unit starts up. If this fails, contact your retailer or the C-pod Technical Support for assistance.

Winter storage/Shut down unit

If you wish to turn off the unit during winter storage, first put the system in Passive mode on the web portal. Go to *Settings – System mode* and select *Passive mode*. Then disconnect the power supply. The internal battery discharges and the C-pod turns off.

When you wish to use the system again, reconnect the power and check that the system starts up by observing the flashing of the activation button. In rare cases a power cycle is needed; refer to the Reference manual, section Power-cycling a unit.

Reference manual

Activation button flashes
System Flashes – *these flashes occur independently of user action.*

Start-up flashes:
Once every second: The C-pod has just started/rebooted and is connecting to a cellular (GSM) network.
Once every 3 seconds: The C-pod has just started/rebooted and is looking for a GPS position.
Once every 30 seconds: The C-pod is in normal operation mode.

Error status flashes:
Two times every 30 seconds: The C-pod has no GPS position.
Three times every 30 seconds: The C-pod has no cellular (GSM) network connection.
Four times every 30 seconds: The C-pod has no GPS position and no cellular (GSM) network connection.

Only for unregistered units:
Twice a second: The unit is in Installation test mode. Refer to the Reference manual, *Installation test mode.*

Response Flashes – these flashes confirm user actions after pressing the button.
- *Activate alarms:* Press the button for about 1 second to activate the alarms. The button flashes **4 short** times as a confirmation.
- *Deactivate alarms:* Press the button for about 1 second to deactivate the alarms. The button flashes **1 long** time as a confirmation.

Troubleshooting guide

The troubleshooting guide gives you hints about how a possible problem can be solved. A more detailed troubleshooting guide is available on the web portal, under the menu Help.

In case you are not able to solve the problem using the Troubleshooting Guide, please get in touch with your retailer or C-pod Technical Support. It is very helpful for us if you can tell us what steps and solution attempts you have tried and what the result was.

Communication related problems

Symptoms

- Communication warning triggers
- Alarms show status *unknown* (after activation/deactivation)
- Getting a status takes a long time (either on the web portal or by SMS)
- Getting a status fails (either on the web portal or by SMS)

Reasons & Solutions

- GPRS data traffic is temporarily unavailable or there is a temporary weakness in the cellular (GSM) network.
  ➔ Wait and see if the communication warning turns back to the state OK. Try getting a status. If this succeeds the basic text (SMS) message data traffic is working. If it does not succeed, continue the fault search.
- The cellular (GSM) network is too weak at the location of the boat or there is no coverage.
  ➔ Check the network strength by holding a GSM type cell phone next to the C-pod. If your phone shows a very weak network or no network at all, consider moving the C-pod if the network seems stronger somewhere else in the boat. If the network in general is very weak, a better antenna might be necessary.
- The C-pod is not turned on/has turned off.
  ➔ Check that there is a sufficient power supply. If the unit has turned off due to a longer power outage (longer than 2 days), please see the section Power related problems.
- ‣**Note:** While still in the boat, you can request a status text (SMS) message by sending status to the C-pod System Number. In the reply text (SMS) message you can see if the GSM and GPRS communication works.

GPS related problems

Symptoms

- The GPS position and time is not updated when requesting a status update.
- The Geofence alarm shows status "unknown" after activation/deactivation.
- A pre-programmed tracking does not start.

Reasons & Solutions

- Low GPS signal quality.
  ➔ Try waiting for some hours. The GPS satellites are moving constantly, so if this occurs just once this can be a reason.
- The GPS antenna is not correctly mounted or mounted in a bad location.
  ➔ Something may obstruct the GPS antenna or disturb the GPS signals. Try moving the antenna from its current location. If possible, temporarily place the antenna under the free sky, with the plastic dome facing upwards. If this makes the GPS work again, find a more suitable permanent location. Strictly avoid antenna placements with metal or carbon fiber between the antenna and the sky.
- The GPS antenna cable, the connector or the antenna itself is damaged.
  ➔ Check the equipment for damages. Replace if necessary.
- ‣**Note:** While still onboard, you can request a position report text (SMS) message by sending position to the C-pod System Number. If you receive a reply message with an updated timestamp and position, you know that the current placement of the GPS antenna works.

Alarm loop related problems

Symptoms

- Alarms trigger and notifications are sent without anything being wrong on the boat (false alarms)
- Alarms cannot be activated
- Alarm loops show status *unknown*

Reasons & Solutions

- The corresponding port on the C-pod is empty, but is configured as enabled on your web portal.
  ➔ Disable the alarm loop on the menu Alarms on the web portal. A port without any attached sensor **must** be disabled!

Troubleshooting guide

- A port on a hub is left open.
  ➔ Install a termination plug on the open port. There must be something connected to all ports of the hub!
- The cable to a sensor or a hub (optional) is damaged.
  ➔ Check the affected cables. Replace if necessary.
- Something is wrong with the sensor/one of the sensors on that loop.
  ➔ Make sure all conditions for the sensor are right. Ensure a working magnet close to the sensor part for the magnetic intrusion sensor, cover the motion detector with a dark, thick cloth or dry off the water level sensor completely. Activate the alarms and see if a false alarm occurs.

  If there are several sensors connected to the loop using one or more hubs (optional), replace a suspected sensor with a termination plug and activate the alarms. If the system acts stable with a certain sensor replaced by the termination plug, that sensor likely is causing the false alarms. Repeat this procedure for the remaining sensors if necessary.
- Alarm loop is disabled or extra accessories (optional) have not been activated.
  ➔ Enable the alarm loop on the menu Alarms or activate new sensors on the menu *Accessories* (refer to the accessory's manual).
- There is a communication problem with the C-pod. The C-pod cannot report the current alarm status to the server.
  ➔ Refer to section *Communication related problems*.

Power related problems

Symptoms
- Recurring power related warnings, i.e. battery level and power save warnings
- Battery Disconnect alarms
- Unit does not start up

Reasons & Solutions
- The power cable is too long which leads to a voltage loss.
  ➔ When using the power cable in its original length, there is a noticeable power drop along the way. The C-pod shows a lower value than

the battery actually has. Shortening the power cable gives a more accurate reading.
- There is corrosion and/or moisture on contacts or cable shoes.
  ➔ Make sure that every connection looks fine and is protected from moisture and dirt.
- The battery is old and weak or empty.
  ➔ Charge the battery or install a new one if necessary.
- There are many power consumers onboard.
  ➔ Some electrical devices draw a considerable current when starting up (i.e. fridges or heaters), which leads to a temporary voltage drop that can trigger a warning.
- A shore power converter creates ripple currents.
  ➔ Some shore power converters have special charging procedures that can confuse the voltage measuring of the C-pod System. This is a likely cause if you only get warnings when connected to shore power.
- The start-up sequence was interrupted.
  ➔ If the unit suffered from a power loss earlier on, it may have shut down in an improper way. Refer to *Power cycling the unit*.
- ▸**Note:** the power consumption of the C-pod increases when the internal battery is being charged. Motion detectors, water level sensors, relays and smoke detectors add to the overall power consumption of the system while the alarm loops are active.

Messaging and notification problems

Symptoms
- No reply messages from system after commands
- Error message from the C-pod System Number
- No notifications from system

Reasons & Solutions
- Sending a text (SMS) command to the wrong number.
  ➔ Usually texting a wrong number will have no result at all. You might get an answer from someone or from another text (SMS) message service. Make sure you have the right number.
- Sending a wrong/unknown text (SMS) command.
  ➔ Given that you send the message to the right number and the communication is work-

Troubleshooting guide

ing fine, you will get an error message back. Refer to *Text (SMS) commands*.

• Attempting to send commands using a phone not set as main phone number on the web portal.
➔ The C-pod only accepts commands from one number per account. Make sure to use the phone currently set as Main cell phone number on the web portal. Verify or change this number under *Settings - User Info - Contact Information*.

• There are several C-pod Systems registered on the same phone number.
➔ Specify which boat is meant by adding the boat name to the text (SMS) command (e.g. *activate boat name*).

• The alarm notification is not activated in the *Action Plan*.
➔ Go to the Action Plan on the web portal and check that the settings are correct.

• The alarm/warning recipient number is wrong in the *Action Plan*.
➔ Go to the Action Plan on the web portal and check that the settings are correct. Delete the wrong number by un-checking all boxes. Add a new recipient with the correct number.

Web portal problems
Symptoms
• Browser error message, page not found
• Logon fails
• The web portal is displayed wrong or the map view does not work

Reasons & Solutions
• You entered the wrong address (URL).
➔ Check that you are accessing the correct web address, **www.mycpod.com**.

• The user name and/or the password is wrong.
➔ Double-check that you have the correct login name and password. If you have forgotten your login data, send a text (SMS) message to the C-pod System Number from your main cell phone. The system will send the current login data to you in a reply text (SMS) message.

• The version of your browser is too old.
➔ Be sure to have the latest version of your web browser. Our page needs at least Internet Explorer 7 or Mozilla Firefox 3 to work flaw-

lessly. We do not guarantee that the web portal is fully compatible with Chrome, Safari or Opera.

• The map does not work/the Java plug-in is missing.
➔ Install the required Java plug-in on your web browser. It is required to display the map and can be found at **www.java.com**.
